1

Disconnect light harnesses, existing winch connections, and remove existing bumper, and skid plate. Place the winch mount over the frame horns. Insert bolts through winch mount, frame horn, and fasten using the supplied washers and nuts. Tighten to 66 ft/lbs.

2

Set winch into the top of winch mount and fasten nuts to manufacturer specification.

3

Pre-install the fairlead and fairlead light mount (if applicable). Place the bumper shell over the winch mount so that the shackle mounts come through the openings on the front of the bumper shell.

4

Place the bumper hoop on top of the bumper shell. Align the holes and run all six bolts through the hoop and shell, into the winch mount. Fasten securely.
